The lac operon of the model bacterium Escherichia coli was the first operon to be discovered and provides a typical example of operon function. It consists of three adjacent structural genes, a promoter, a terminator, and an operator. The lac operon is regulated by several factors including the availability of glucose and lactose. It can be activated by allolactose.

INTRODUCTION. Eukaryotic cells have developed several mechanisms to respond to rapid increases in temperature. On heat stress, cells reduce the rate of synthesis of proteins that were expressed before the heat shock and change their transcription profile dramatically to produce mainly heat shock responsive proteins (Gasch et al., 2000; Murray et al., 2004).
